My connections to the microscopic world

- Microfossils - biostratigraphy and paleoecology
- Foraminifera - Carpathian mountains and Cheliff Basin - N Africa

Define Badenian stage in Carpathians piedmont (central Europe =- Parathetys) vs Tortonian (Mediterranean Basin - Tethys)

***Tortonian / Messinian
stratigraphy and
paleoecology in the
Cheliff Basin diatomites***

Diatoms: Climate and Fire dynamics

Summary

- **Background** -What are diatoms?
Why diatoms are great ecological indicators
- **How are diatoms used in environmental reconstructions**
- **Diatom-based applications for assessment, monitoring and restoration potential in NJ**

What are diatoms?

- Single celled algae enclosed in silica shells
- Photosynthetic
- Cell walls made of transparent, opaline silica
- Ornamented by intricate and striking patterns
- Microscopic - 2 μm to 500 μm (= 0.5 mm)

Why are diatoms important?

- Produce 20-30% of earth oxygen
- Remove CO₂ from atmosphere, convert to organic C (sugar) and release O₂
- Important source of food to the food web due to long chain fatty acids
- 20K-2M species, every year new species are discovered
- Tell us the condition of the environment
- Can serve as surrogate to instrumental measurements
- Practical applications for environment protection

HT = 10.00 kV
g = 8.65 K X
WD = 6.4 mm
Vacuum M
Detector = L

1 μ m*

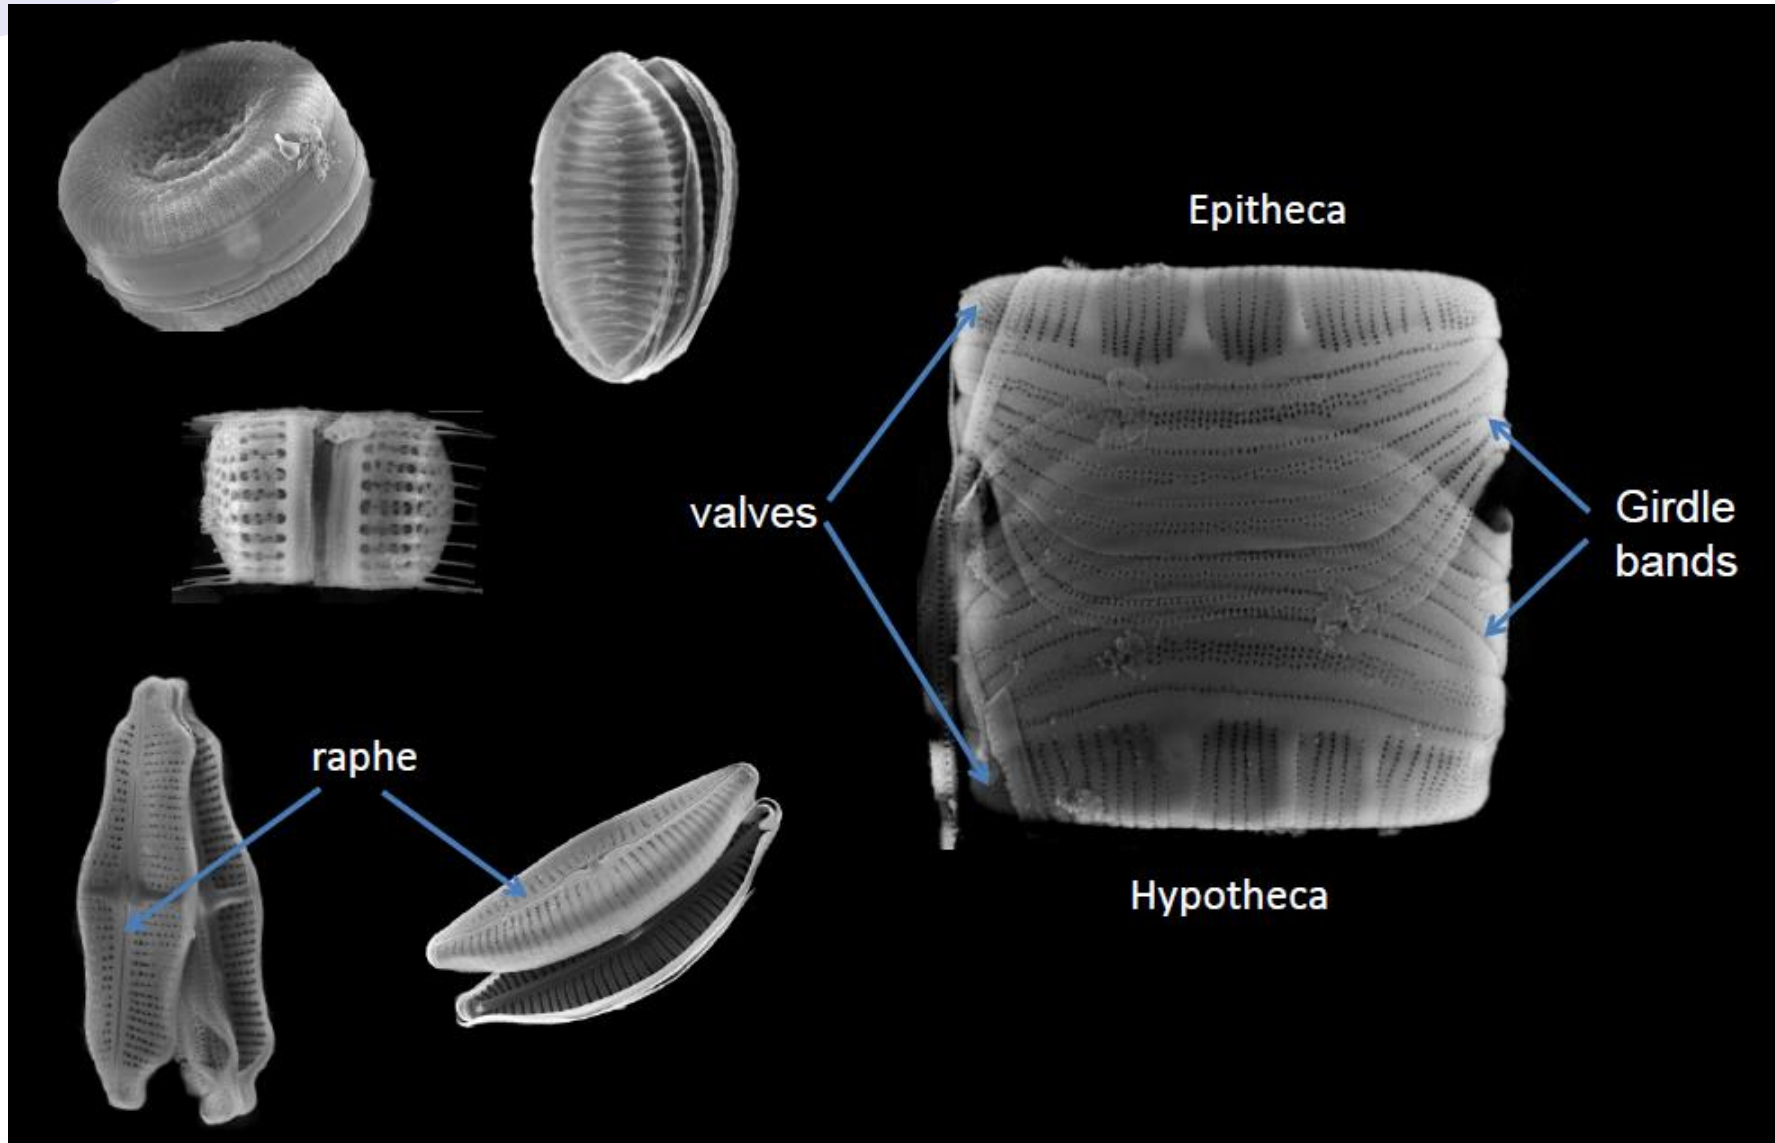

Small in size but big in function!

- Diatoms in Barnegat Bay salt marshes

Diatom skeleton: frustule

Why diatoms are great environmental indicators

- 1) Species are highly sensitive to environmental factors with specific optima and tolerance
- 2) Their silica shells preserve and accumulate in sediment deposits reflecting the environmental conditions before death

Diatoms and the environmental calibration

- Diatoms ecological response needs to be quantified
- Requires sampling of both diatom and environmental data, tandem samples for same site / time
- In NJ relationships of diatoms to nutrient concentrations, salinity, sediment N and C, tidal inundation, pollution factors have been or are currently being investigated

The calibration step

The calibration step

- Two factors can ensure the success of this step:
- 1) sample a wide gradient of environmental parameter of interest
- 2) species identification (taxonomy)
- Requires two data sets one for the biological data and one for the environmental data

Y matrix=
Species

X matrix=
Environ.
Data

$$Y = \hat{U}X$$

CLEAN

POLLUTED

Environmental Gradient

Diatom Voucher florae

- Voucher florae provide species identification and illustration that can be used to ensure taxonomic consistency

- NJ coastal wetlands voucher flora (DSR website)

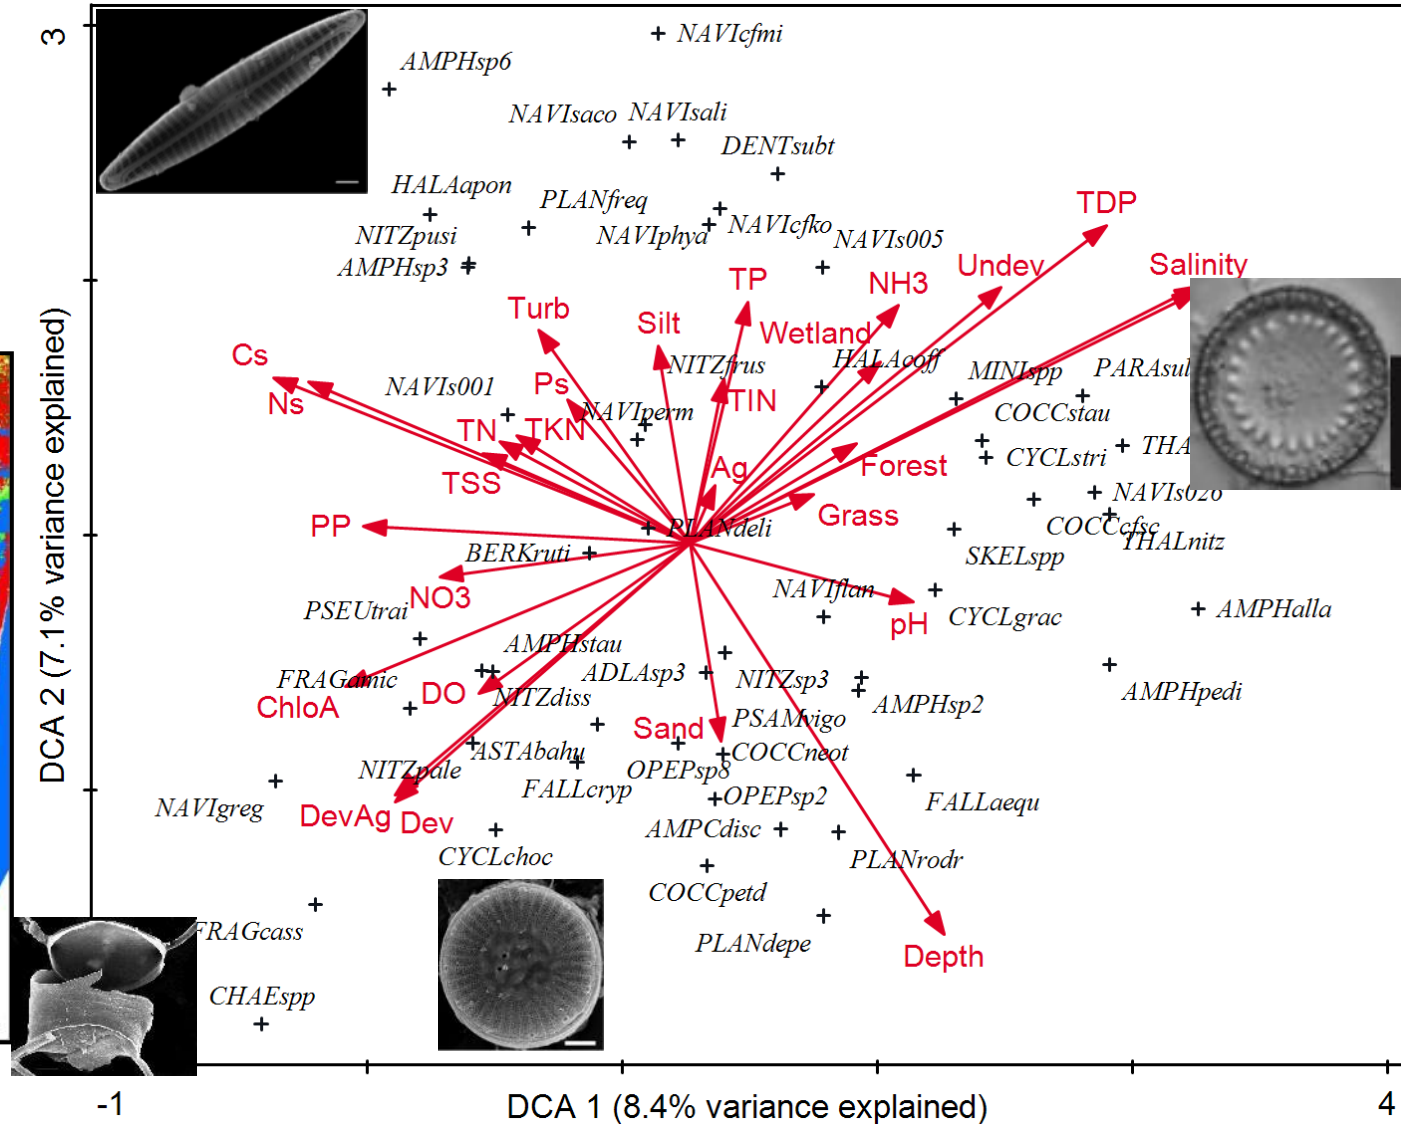

[Diatom Flora of the New Jersey Coastal Wetlands](#)

Illustrate 499 species

- NE lakes Voucher flora (includes NJ lakes)-diatoms.org
- Pinelands ponds voucher flora ongoing

Example of calibration in Barnegat Bay

100 samples, 40 dominant species, 29 environmental variables

Strength of the relationships between diatom assemblage composition and environmental variables as measured by the significance of the first CCA axes

Environmental variable	F-ratio	P-value
Chlorophyll A, Log $\mu\text{g/L}$	2.5	0.001
Particulate Phosphorus, Log $\mu\text{g P/L}$	2.4	0.002
Total Dissolved Phosphorus, Log $\mu\text{g P/L}$	3.5	0.001
Total Phosphorus, Log $\mu\text{g P/L}$	3.1	0.001
Ammonia, Log $\mu\text{g N/L}$	2.0	0.006
Nitrate + Nitrite, Log $\mu\text{g N/L}$	2.5	0.004
Total Inorganic Nitrogen, $\mu\text{g N/L}$	2.3	0.002
Carbon sediment, Log $\mu\text{g/g}$	4.2	0.001
Nitrogen sediment, Log $\mu\text{g/g}$	4.7	0.001
Phosphorus sediment, Log $\mu\text{g/g}$	3.3	0.001
“Developed” land-use, sqrt %	2.5	0.001

* The effect of salinity is taken out

Weighted-averaging partial-least square inference model for sediment N, 2nd component:

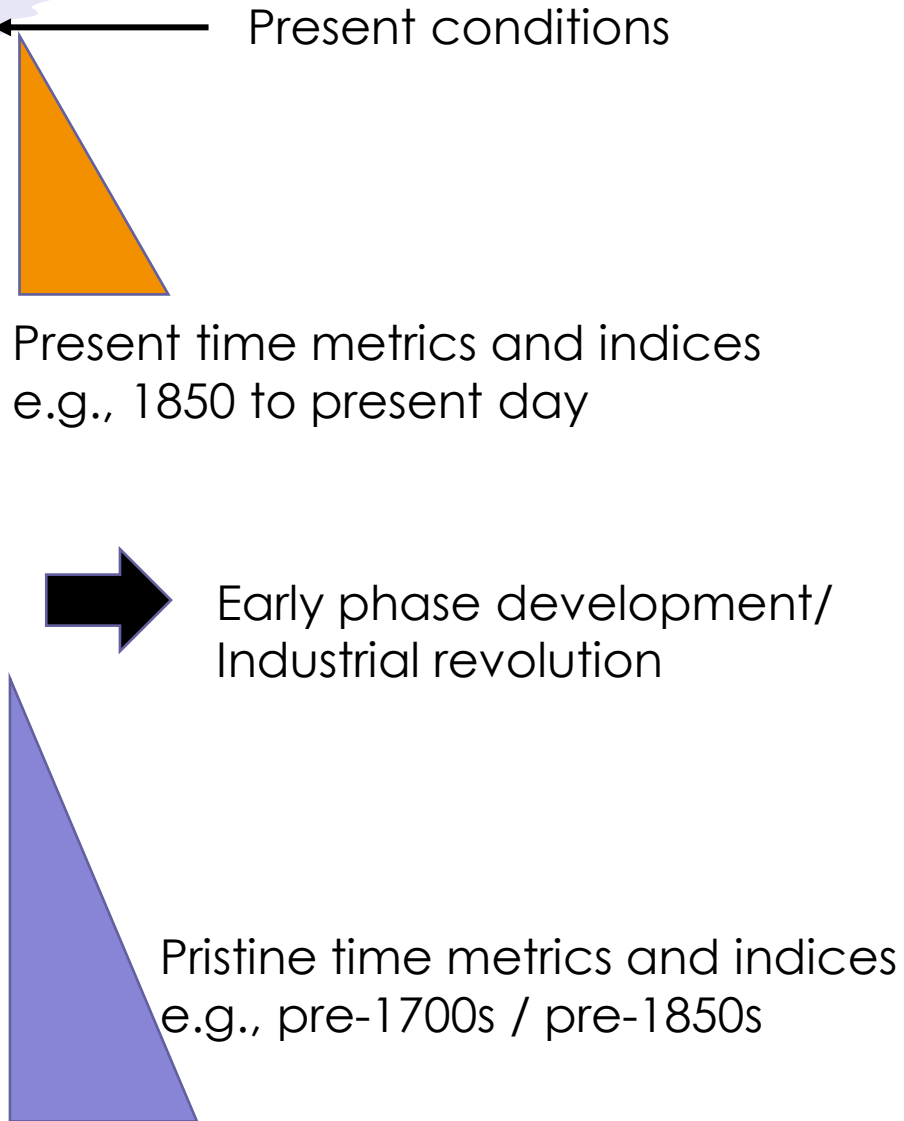

$$R^2 = 0.87,$$

$$R^2_{\text{boot}} = 0.55$$

$$\text{RMSEP} = 0.30$$

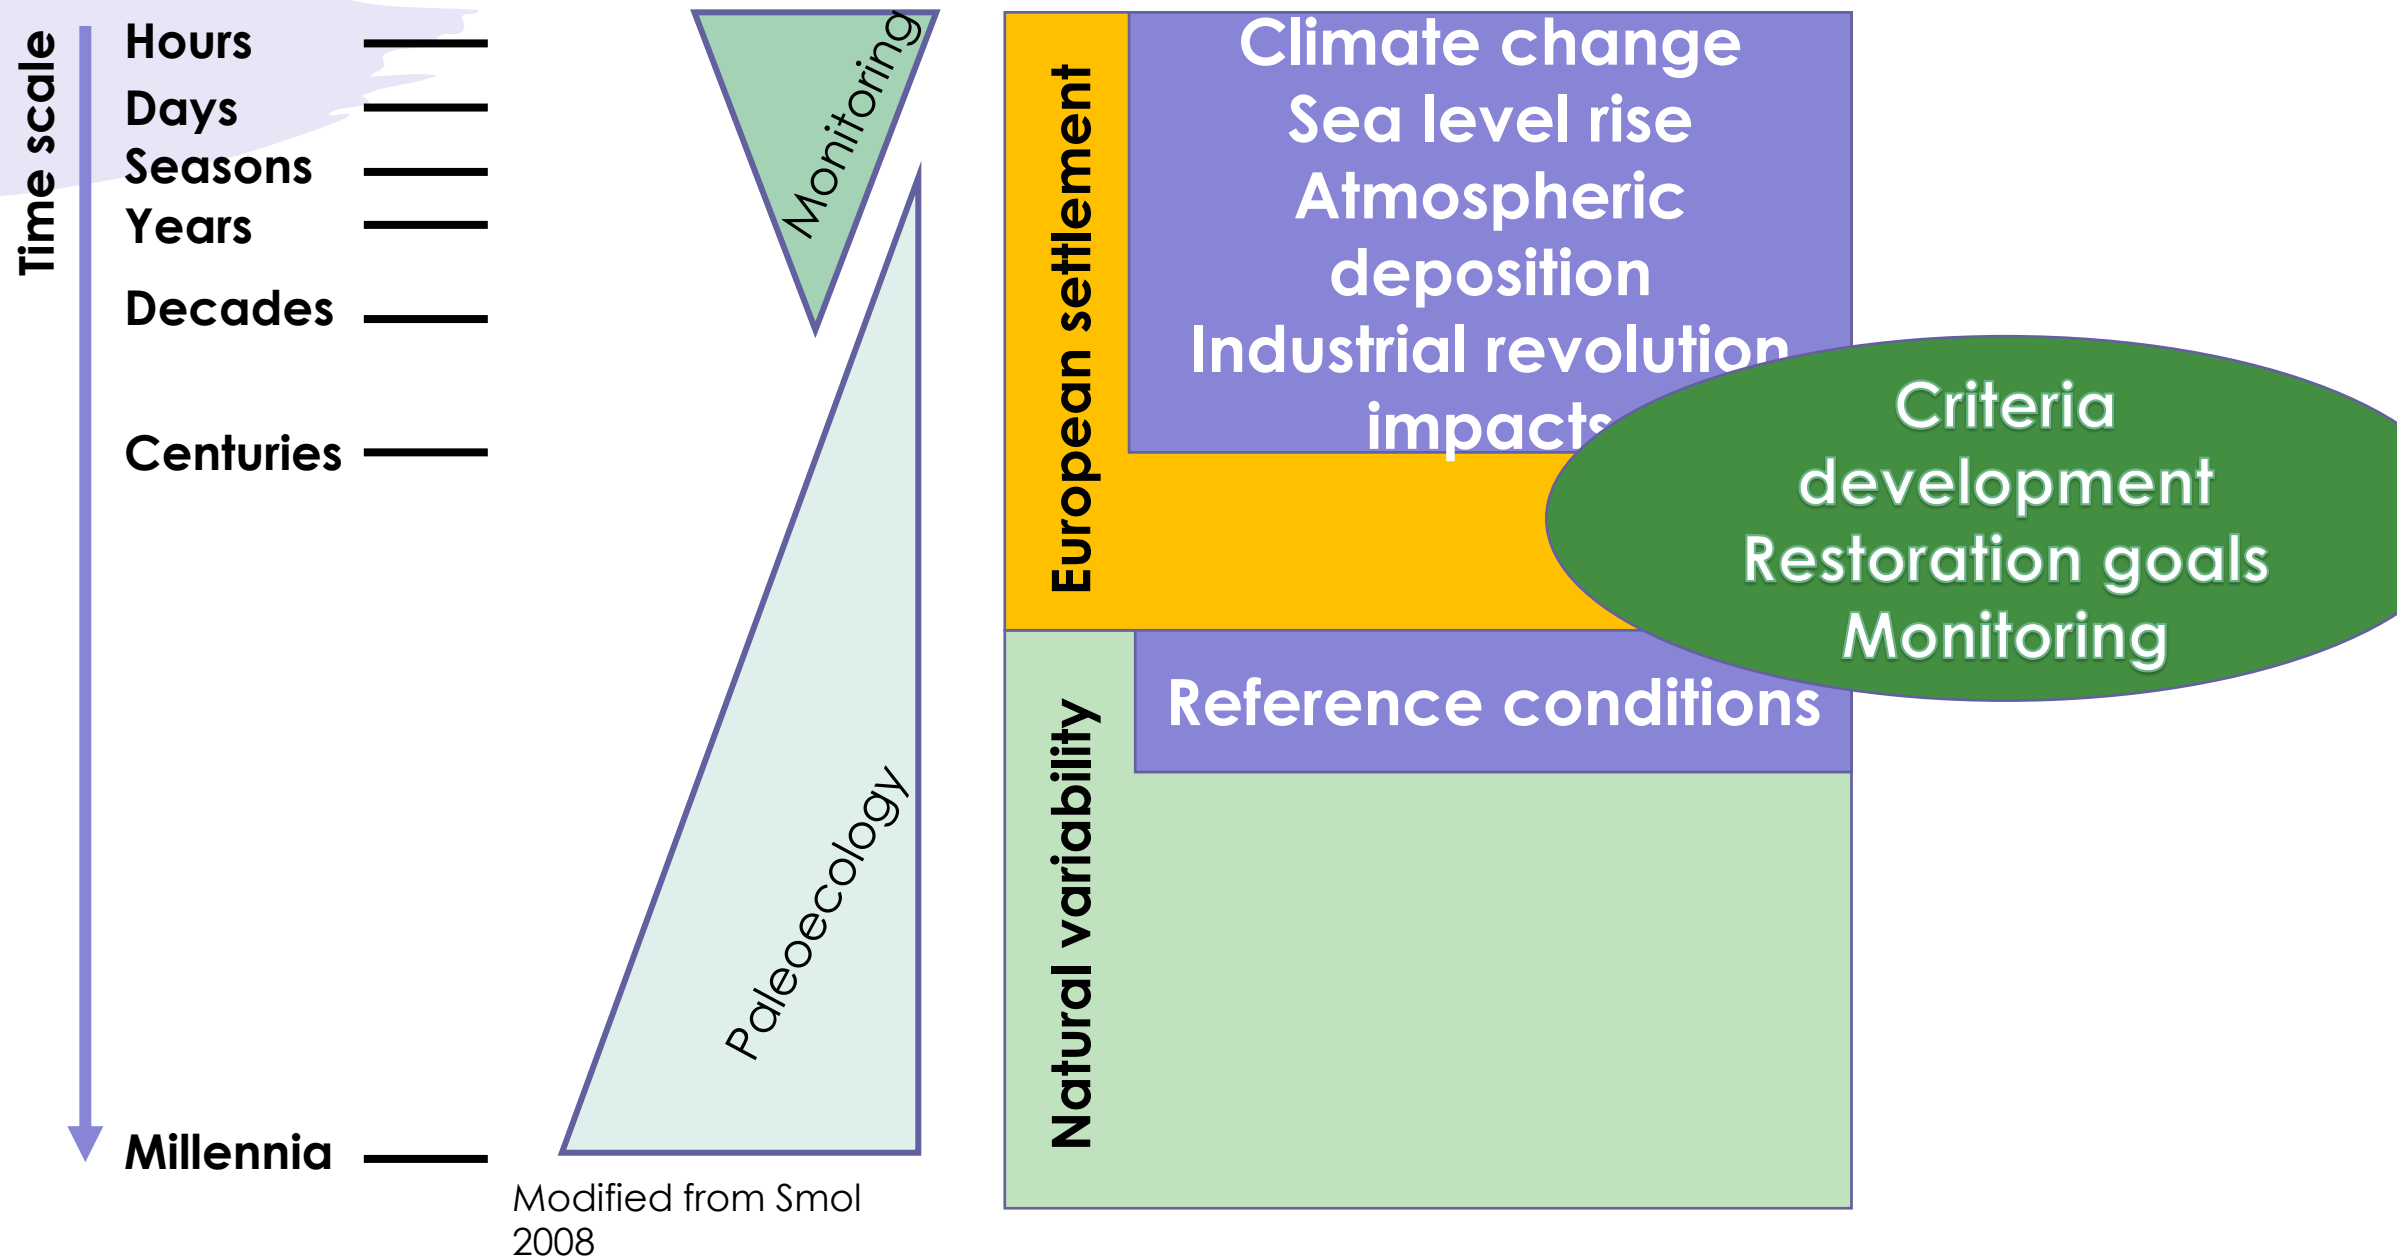

Diatom-based environmental reconstructions

- Once the calibration step is complete, the diatom-based transfer functions are ready to be used for reconstructing environmental parameters from sediment archives:

$$X = \hat{U}^{-1}Y$$

Sedimentary deposits information

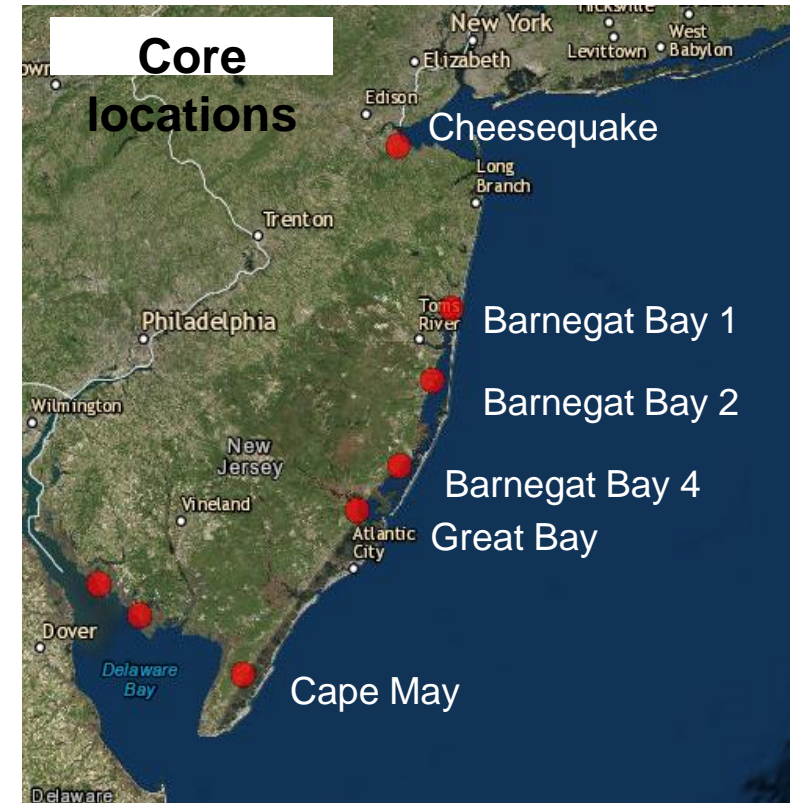

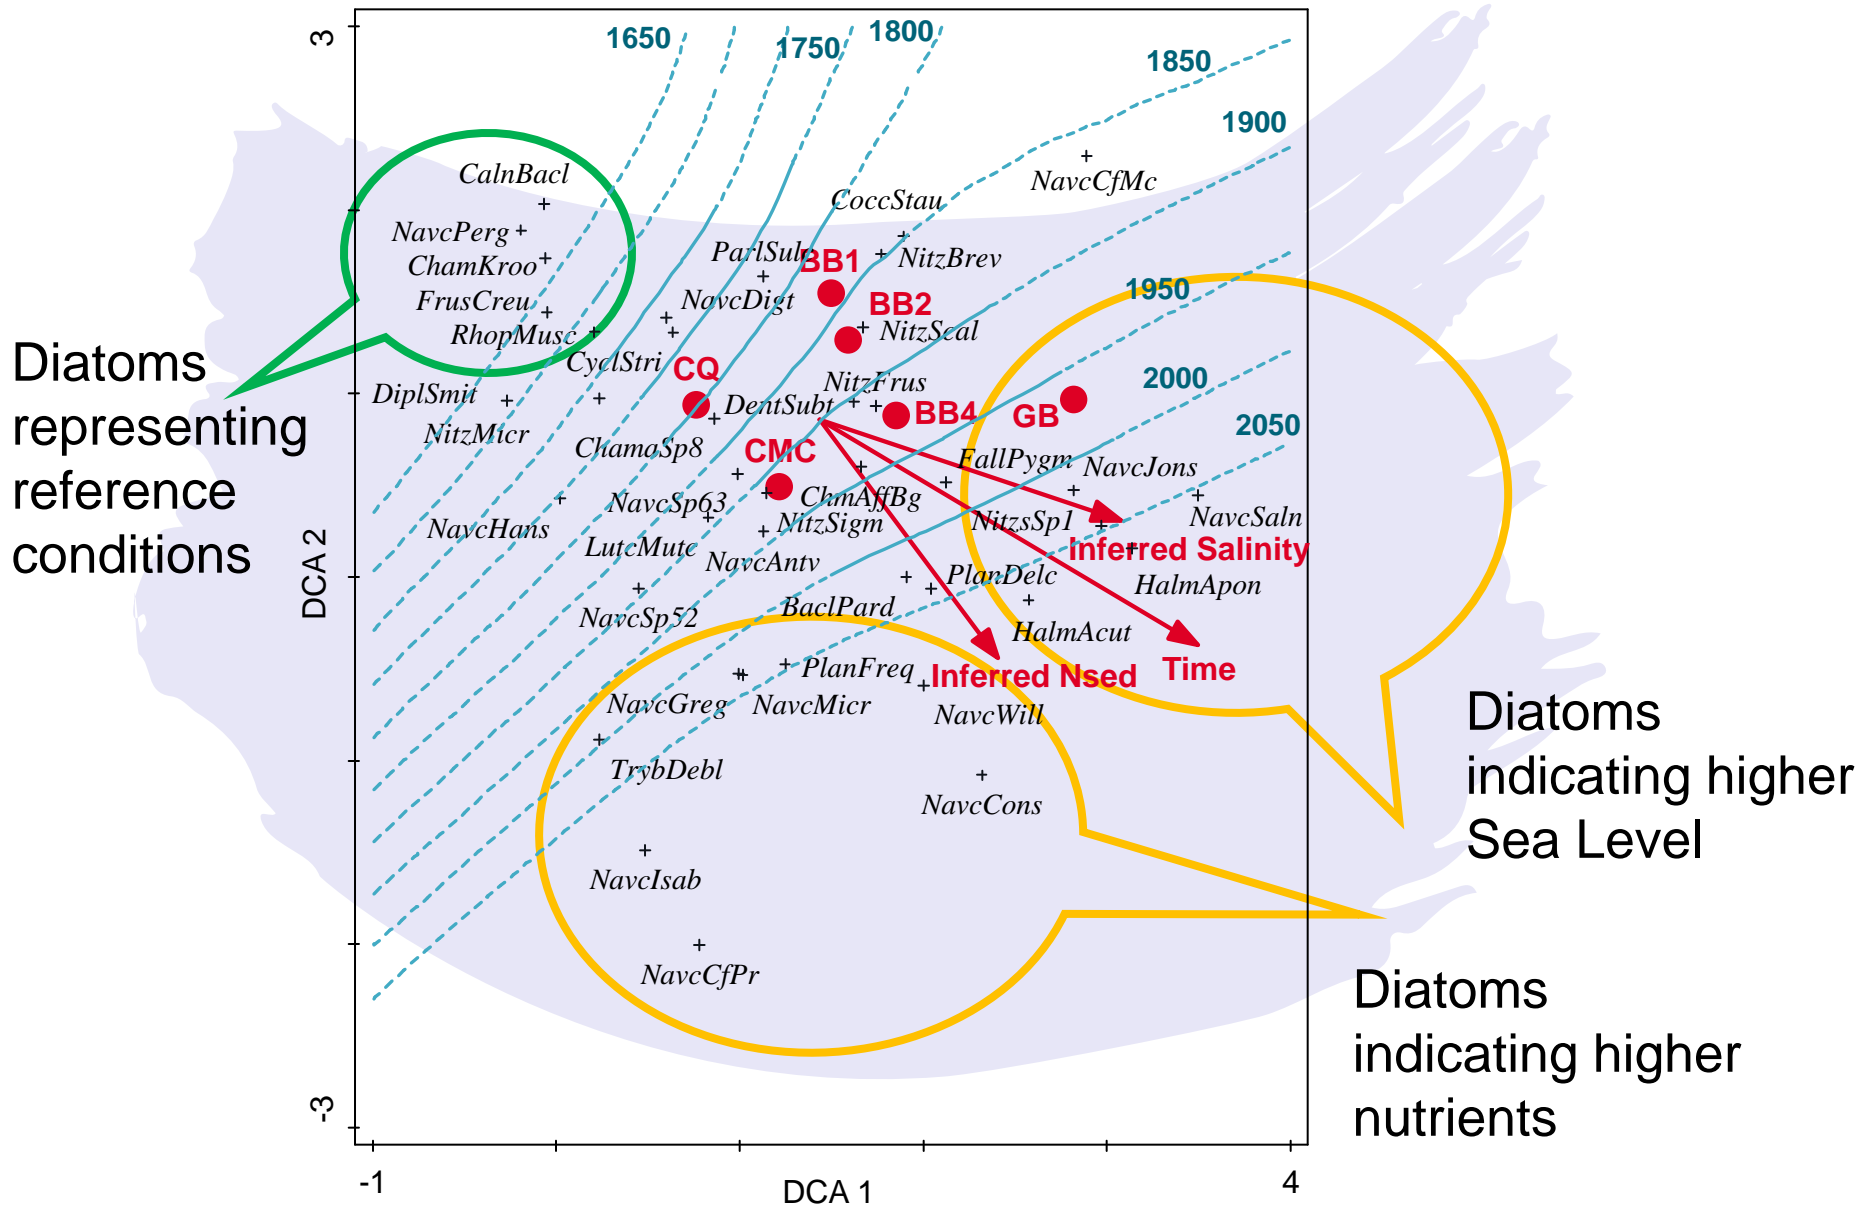

***Diatom-based applications in
New Jersey coastal wetlands***

1. NJ wetlands reference conditions, European settlement effects and changes since the EPA's clean water act

- Six sediment cores were collected from N to south from coastal marshes
- The goal was to reconstruct reference conditions, the impact of European settlement, and relationships to current conditions
- Evaluate importance of change for management practices
- Two additional cores in DE estuary were collected to evaluate impact and recovery after strong erosion events
- [New Jersey \(USA\) Wetlands Past, Present and Future: Using Sediment Archives to Inform and Guide Wetland Protection, Restoration and Resilience](#)

Diatoms representing reference conditions

Diatoms indicating higher Sea Level

Diatoms indicating higher nutrients

Reference diatoms

Paralia sulcata

Cyclotella striata

Nitzschia brevissima

Diploneis smithii

Navicula digitoradiata

Caloneis bacillum

High nitrogen indicators

Cyclotella choctawatcheana

Cyclotella atomus var. *gracilis*

Nitzschia frustulum

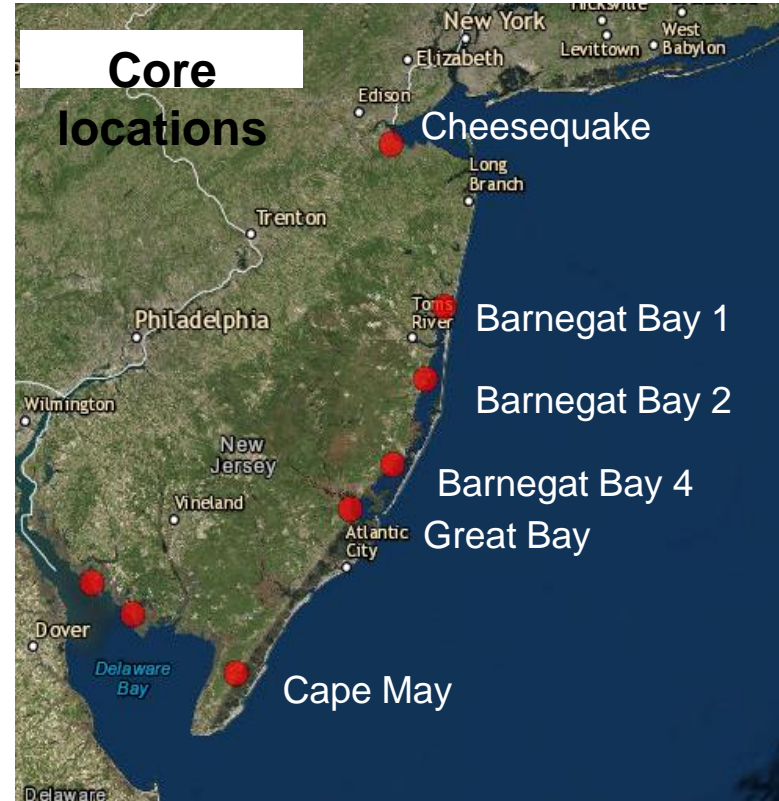

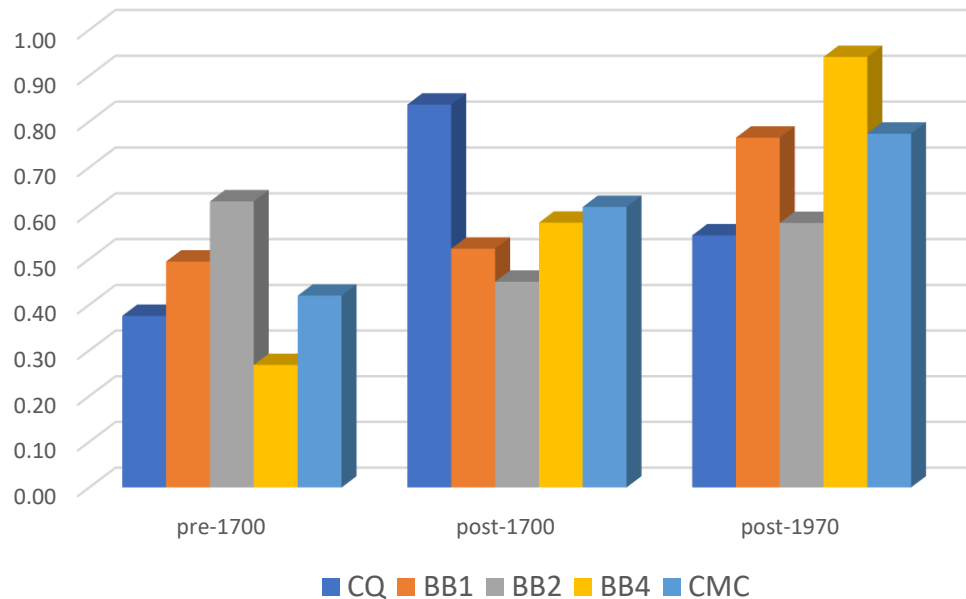

Planothidium frequentissimum

Ref species with monitoring potential

Indicator	Reference conditions			Present-day conditions		
	HD	MD	LD	HD	MD	LD
Diatom species	HD	MD	LD	HD	MD	LD
<i>Amphicocconeis disculoides</i>	Y	Y	Y	N	N	N
<i>Caloneis bacillum</i>	Y	Y	Y	N	Y	Y
<i>Cocconeis placentula</i> var. <i>lineata</i>	Y	Y	Y	N	N	N
<i>Cocconeis stauroneiformis</i>	Y	Y	Y	N	Y	N
<i>Cosmioneis pusilla</i>	Y	Y	Y	Y	N	N
<i>Cyclotella striata</i>	Y	Y	Y	Y	Y	Y
<i>Cymatosira belgica</i>	Y	Y	Y	N	N	Y
<i>Frustulia creuzburgensis</i>	Y	Y	Y	N	Y	Y
<i>Navicula digitoconvergens</i>	Y	Y	Y	Y	Y	Y
<i>Navicula peregrina</i>	Y	Y	Y	N	Y	Y
<i>Opephora</i> sp. 2 COAST	Y	Y	Y	N	N	N
<i>Paralia sulcata</i>	Y	Y	Y	Y	Y	Y
<i>Rhopalodia musculus</i>	Y	Y	Y	Y	N	N
<i>Thalassionema nitzschioides</i>	Y	Y	Y	Y	N	Y
<i>Thalassiora oestrupii</i>	Y	Y	Y	Y	N	Y
Inferred Nitrogen Min-Max (%)	0.2-0.8	0.1-0.9	0.2-2.1*	0.4-0.8	0.6-1.2	0.2-0.6
Salinity Min-Max (psu)	16-30	12-29	12-29*	20-27	11-27	25-29

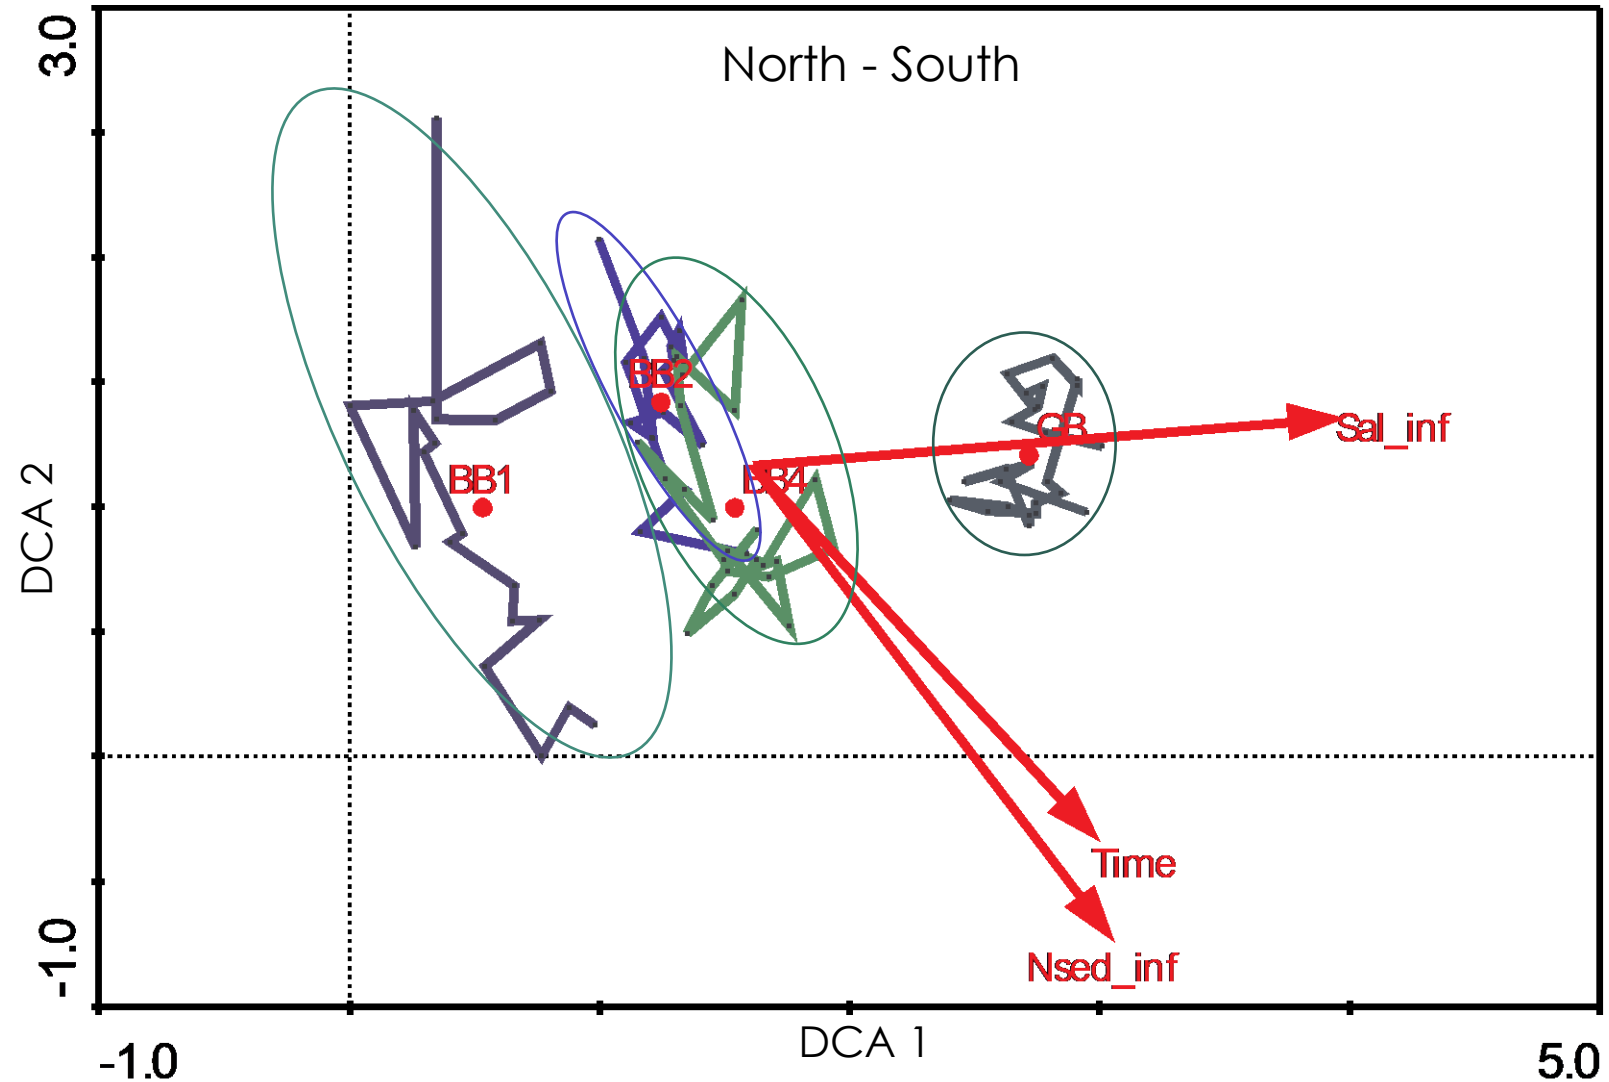

Condition assessment and restoration goals

- What are reference nutrient concentrations? Impact of human activities?
- How did the EPA Clean water act impact wetland nutrient values?
- Nutrient pollution – which sites must be prioritized for restoration practices?

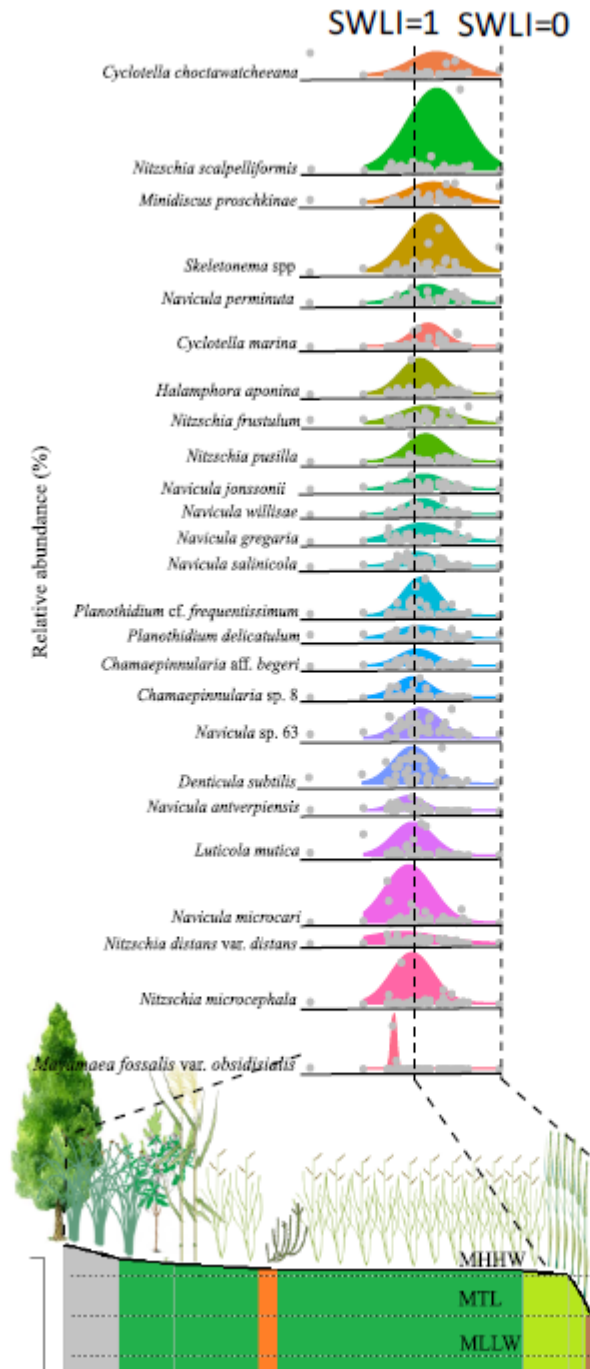

Setting monitoring and restoration goals

Increase in species associated with nutrient pollution in north; and sea level rise in south

2. Wetlands diatoms indicate tidal exposure / SLR impacts

- ~900 diatoms species, 1/3 new to science in NJ wetlands
- Diatom wetland Voucher flora – available on DSR website
- Calibration set 388 modern samples NJ-NY
- Transfer functions developed for salinity, TN and tidal exposure: TEI & SWLI
- Desianti et al. 2019 Estuaries and Coasts

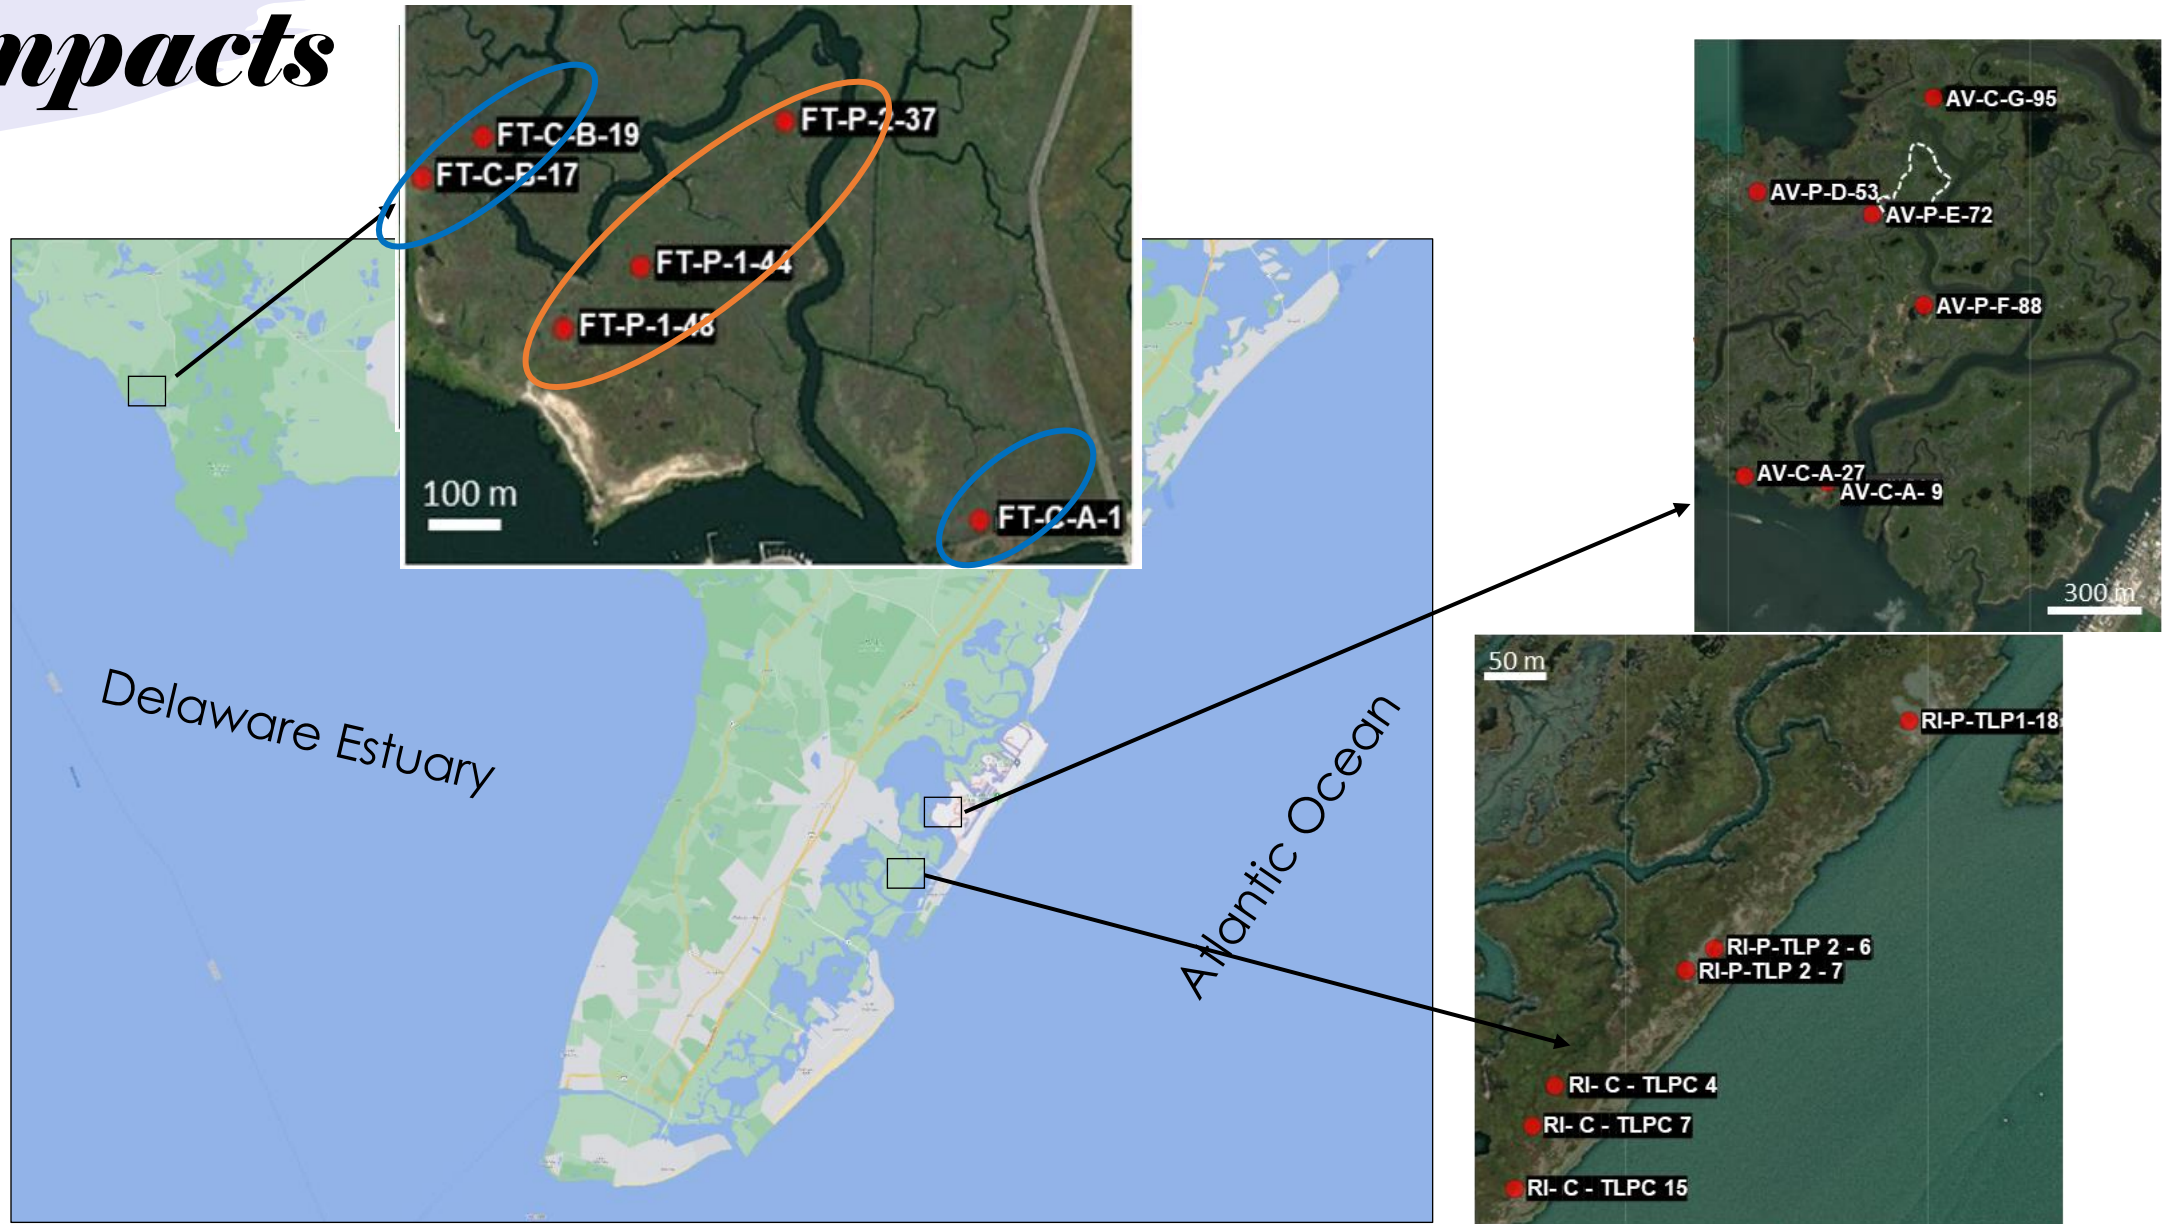

NMDS ordinations of 100 sites across New Jersey salt marshes.

Contour map of the diatom-based inferred values of the Tidal Exposure Index (TEI) is generated via interpolating inferred values of TEI.

Allows identification of sites most exposed to tidal impacts: e.g., TUK5A, etc.

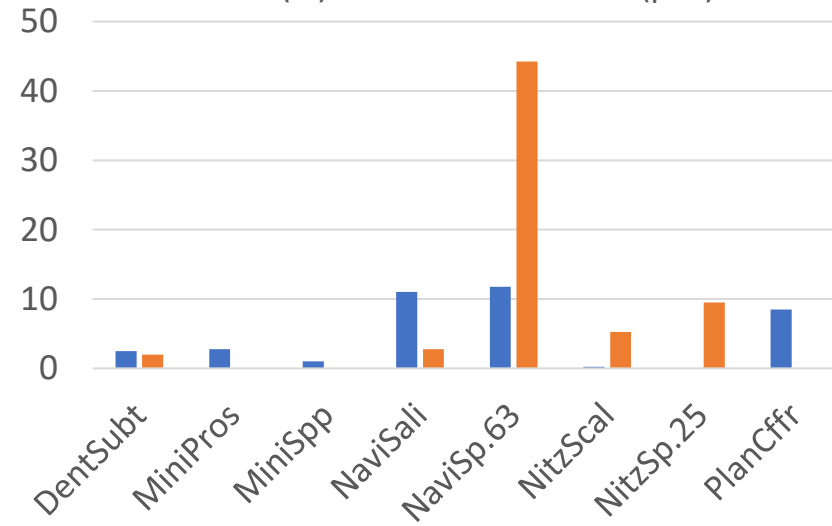

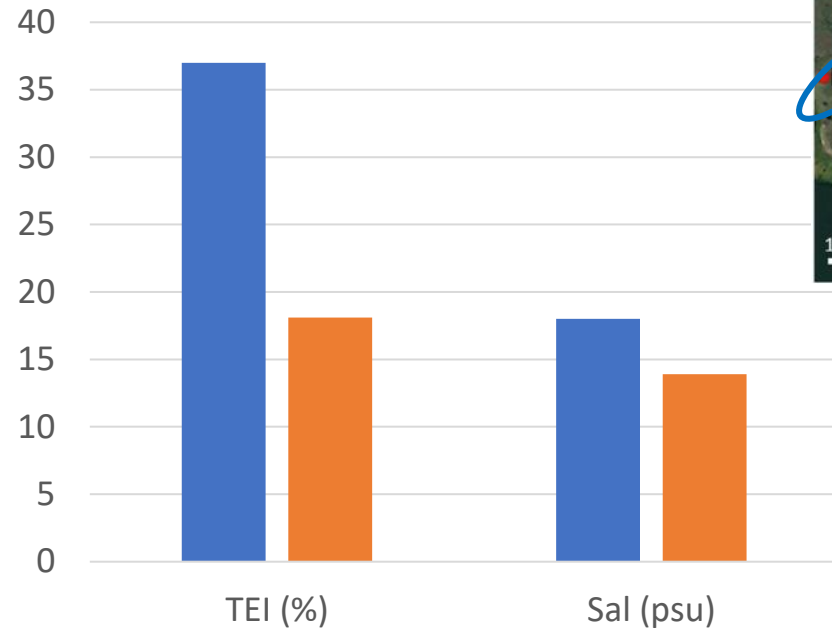

3. Assessment of Thin Layer Placement impacts

Fortescue comparison TLP and Control sites

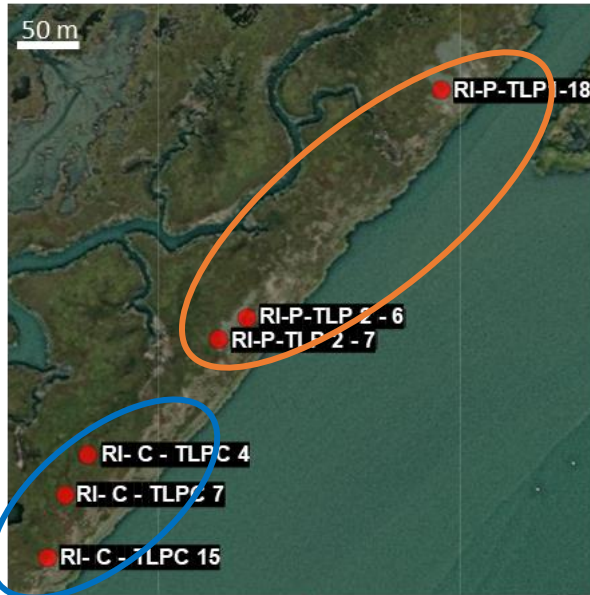

Low Marsh: FTP 1 44; FTP 2 37
FTC B 19; FTCB 17

High Marsh: FTP 1 48
FTC A 1

Ring Island comparison TLP and Control sites

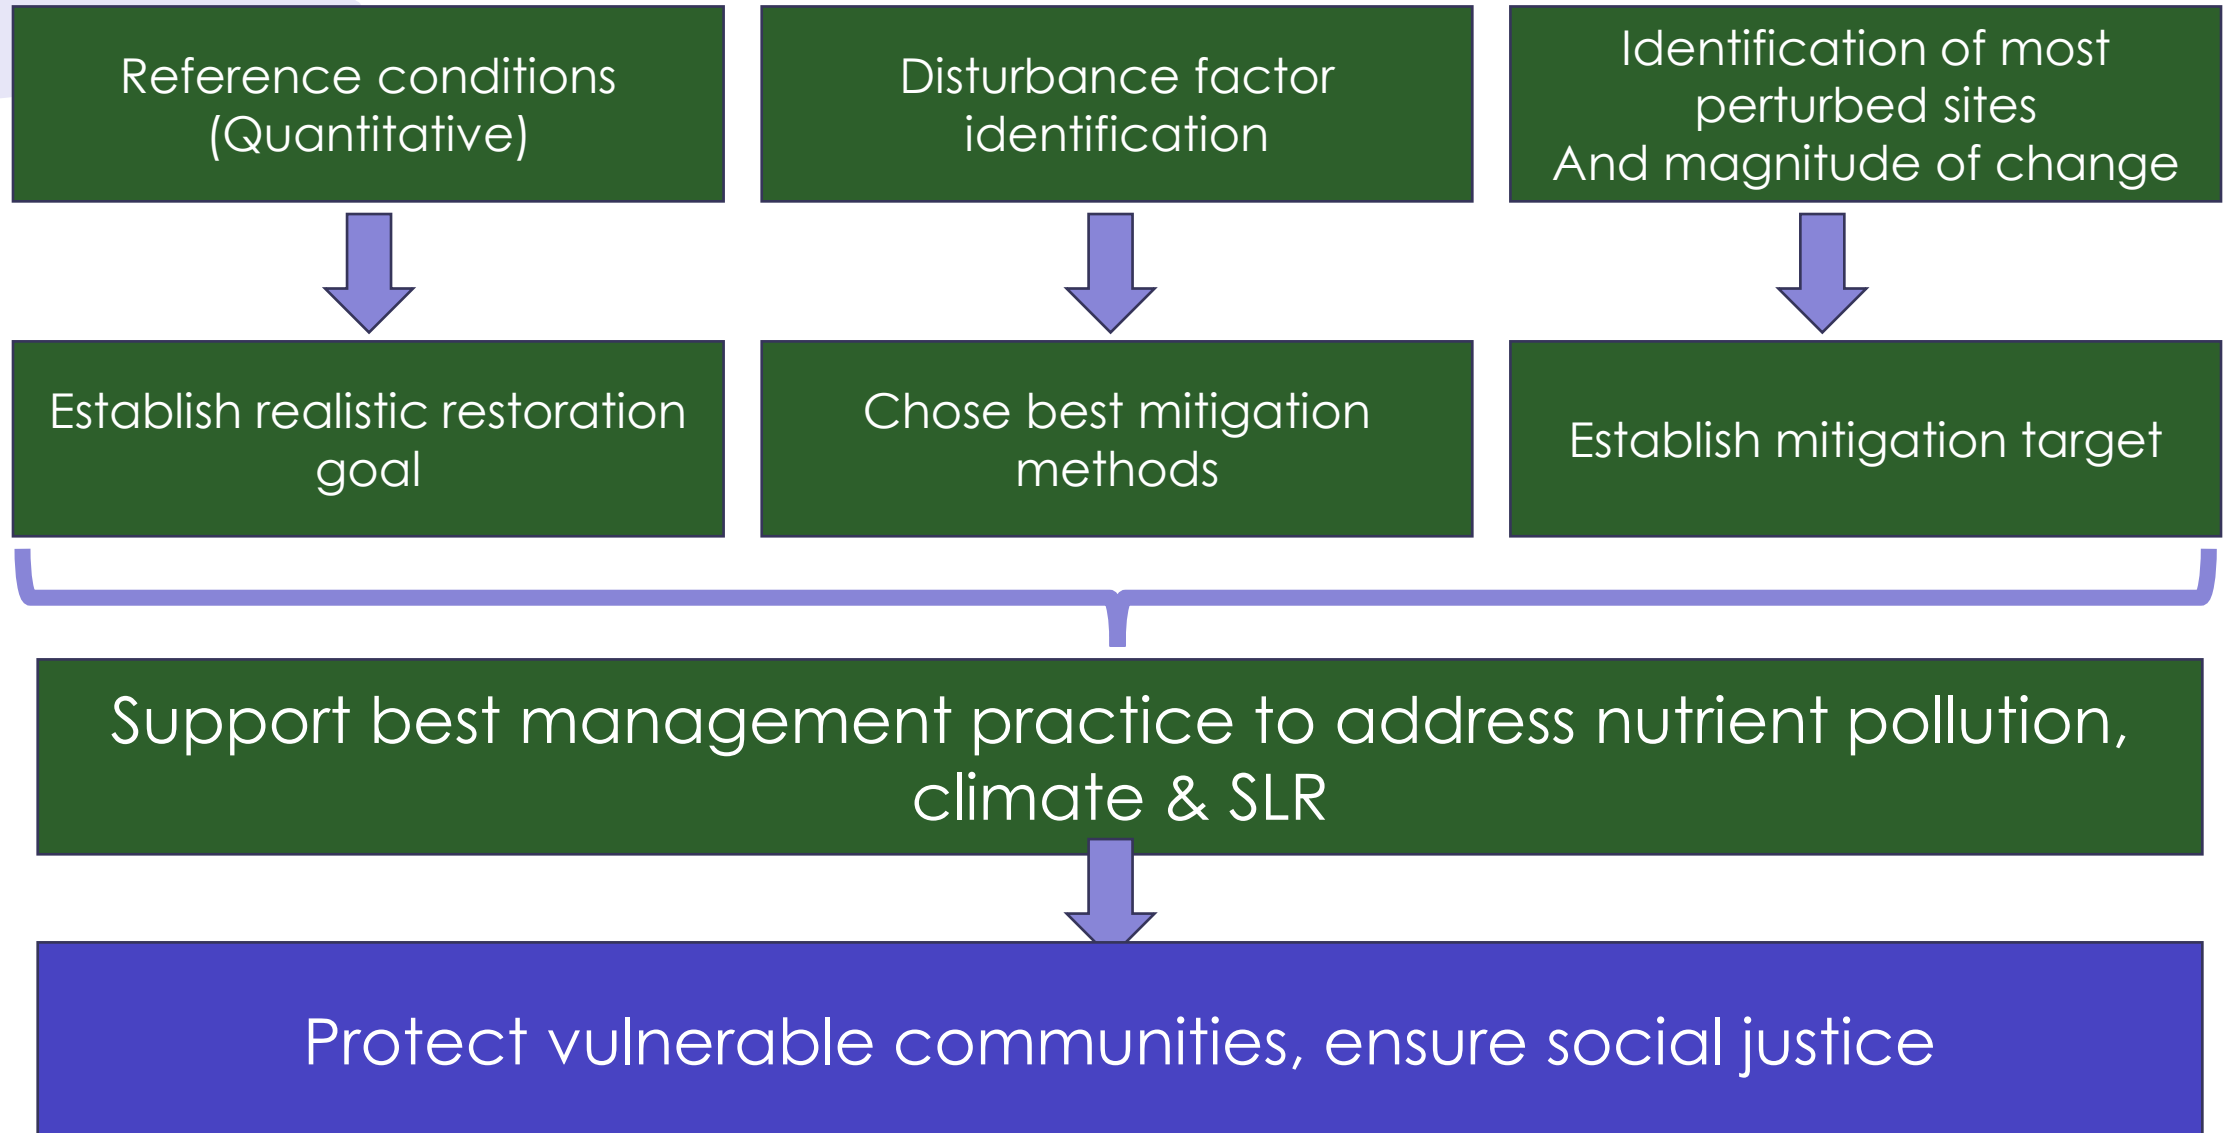

All low marsh sites

Diatoms management applications

Summary

Other DSR projects involving wetland sediment cores/diatoms/other microorganisms

- Sea Level reconstruction over the last 1k at Dennis Creek – Dr. J Walker, Rowan U
- Diatoms and relationships to pore water chemistry – in report: [Mapping and Assessing Tidal Marsh Condition Via Multispectral Imaging](#)
- Harmful algal blooms in salt marsh ponds – ongoing, Drs Ling Ren/Pat Gillevet GMU. Manuscript submitted

*Future diatoms applications:
Develop diatom DNA procedures for
assessment and biomonitoring*

Thank you!
